

# SPRAYABLE FAIRWAY NUTRITION, REDEFINED.

Combining HCU™ and Foltec® SG Minors creates an ideal tank mix of nitrogen, humic acid, and minor elements, and delivers exceptional performance with strong economics in use.

## AN IDEAL TANK MIX

When thinking about proven results and adaptability for fairway-based nutrition, sprayable urea is a mainstay. HCU offers all of the advantages of sprayable urea, coupled with the soil-enriching benefits of a humic coating, resulting in a great food source for both soil microbes and turfgrass. The addition of Foltec SG Minors provides turf with full-spectrum nutritional benefits.

## MIXING INSTRUCTIONS

Foltec SG Minors has been tested and shown to be very soluble with adequate agitation, typical of that provided by most self-contained spray units. When applying Foltec SG products with other active ingredients, it is normally recommended that Foltec SG be placed in the mixing tank first. When mixing with Humic Coated Urea, however, Foltec SG Minors should be added only after HCU dissolution. Follow the steps below to ensure proper mixing of the two products.

### STEP 1

Add HCU to water.

DO NOT pour directly into the tank. Can be solubilized using an inductor, rinsed through a basket strainer, or prepared in a bucket slurry.

### STEP 2

Add Foltec SG Minors.

Can be poured directly into the tank, solubilized using an inductor, or rinsed through a basket strainer.

### STEP 3

Mix thoroughly.
